Range

What it is. The range is used to show the variety in a dataset.

Important. When the range is big, it means that there is large variety in the dataset. If the range is small, it means that there is little variety in the dataset.

Mean

What it is. The mean is obtained for the purpose of summarizing the dataset as part of descriptive statistics.

Important. The mean is often used as a measure for central tendency`in symmetric distributions. Since outliers can have a large effect on the mean, for skew distributions, we prefer the median as a measure of location.

Sensitivity

What it is. The sensitivity is used to show how good a certain test is at testing positive for people with a disease.

Important. When the sensitivity is high, it means that a low amount of people who are actually ill are tested negative on that test. When the sensitivity is low it means that a lot of people who are ill are missed.

Variable

What it is. nan

Important. nan

Population

What it is. nan

Important. nan

Event

What it is. nan

Important. nan

Sample

What it is. Typically, samples are used because an entire population is simply too large and too varied to perform a research on making research impractical or impossible. We use samples and perform statistical tests and make inferences about the entire population.
